DETAILED ACTION

Reasons for Allowance

The claimed use of the tubes in metal casting processes places structural limitations on the composition and form of the tubes. The nearest prior art, Brown et al discloses a multi-layer spirally-wound insulating paper sleeve (tubing) for casting metal articles in sand molds. Brown et al teaches that the tubing must be able to resist transfer of heat during the timeframe of solidification of molten metals used in casting yet decompose evenly into harmless ash during the same time period due to the high temperatures (col 4, lines 44-57). Brown et al teaches that a multi-layered spirally wound sleeve only functions properly if there is a vent or series of vent passages through the sleeve created by leaving a gap between adjacent edges of each spiral winding. Without such vents, portions of the sleeve develop hot spots, ignite and decompose more rapidly than other portions of the sleeve thereby destroying the insulating characteristic of the sleeve. The disclosed vent passages are (col 4, lines 38-43; col 7, lines 49-54; Fig. 2; col 11, lines 5-27). Other prior art discloses tubes for casting that contain an organic and/or an inorganic binder and that are moulded or made from lapped or wound sheets, but fails to disclose spirally-wound tubes with an overlap between adjacent turns (Nagai et al, 4069859; JP-07-3387; JP-09-253792; JP-53-40926; JP-62-154632; JP-11-254091). While edge overlapping is known in general as one process for winding paper tubes, the process is specifically taught by Brown et al as being detrimental to the proper function of the tubes in casting operations, thus the

claimed tubes are not disclosed in prior art and would not have been obvious to one ordinary skill in the art at the time of the invention.
